

How can we build more effective weather visualizations ?

Task-Specific Visualization Design

Lloyd Treinish

IBM Thomas J. Watson Research Center

Yorktown Heights, NY

lloyd@us.ibm.com

<http://www.research.ibm.com/weather>

What's Wrong with Our Visualizations ?

There is a lot that's right, but we can do better.

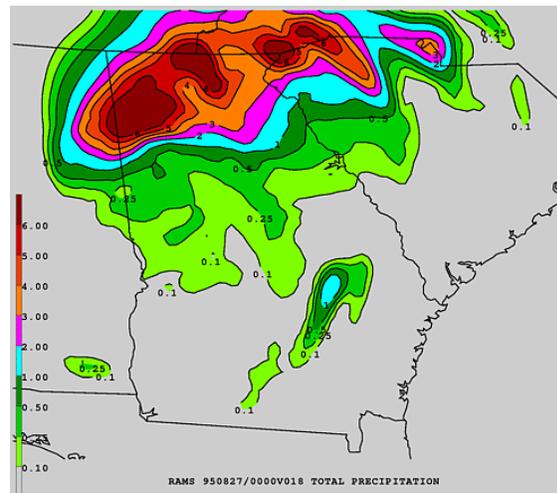

- **Generic methods (content and interface) often fail in operational environments**
 - Lack of focus for specific forecasting tasks
 - Complexity and time-consuming in use and/or training
- **Focused methods may also fail**
 - Not necessarily a reflection on quality of system
 - Mismatch between design focus and user goals
 - Users may not be researchers or professional meteorologists
- **Generic methods may be preferred for research**
 - Need for flexibility and customization
 - Multiple user goals and visualization tasks

How Should We Start ?

1. **Identification of user needs, goals and tasks**
 - Assume user (intelligence) in the loop (domain knowledge)
 - Recognize distinction between requirements in research vs. operational environments
 - Build a taxonomy of visualization tasks and user goals
2. **Composition of design elements and interface actions**
 - Reflect user goals vs. visualization tasks
 - Incorporate knowledge of human perception (pattern recognition)
 - Be consistent with data sources
 - Constrain choices matched to user goals
- **Practical Matters**
 - Share common design elements to reduce development and training costs
 - Minimize iterative refinement with users
 - Need different visualizations for the same users
 - Need different visualizations for different users

Current Operational 2D Visualization

- **Static, batch, typically non-interactive**
- **Two-dimensional techniques with 2-3 variables at most for limited 2d or 2d slices of limited 3d data**
- **Flip-book animation and indirect interaction at best**
- **Single design/interface**
- **Many examples**
 - ▶ GEMPAK, AWIPS, MetView, HORACE, GrADS, NCAR Graphics, VAN, ...
- **Methods do not scale to large data volumes**
 - ▶ Observations, analyses and models
- **Poorly matched for non-analysis tasks and non-meteorologist users**

Visualization Tasks in Meteorology

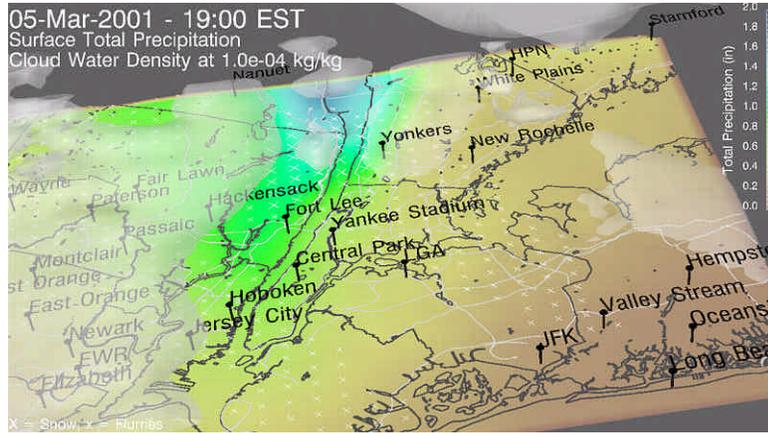

- **Class I: 2d (Traditional Weather Graphics)**
 - Quantitative
 - Users are forecasters
 - Minimal indirect interaction
- **Class II: 2d, 2-1/2d Analysis (new)**
 - Quantitative with potentially complex appearance
 - Users are forecasters, but techniques will be new
 - Support data comparison
 - Direct manipulation important
- **Class III: 3d Browse (new)**
 - Qualitative with simplified appearance (not necessarily content)
 - Users may or may not be specialists (e.g., forecasters & public)
 - Animation with temporal and spatial coherence important
 - Event identification for potential later analysis

Visualization Tasks in Meteorology (Continued)

- **Class IV: 3d Analysis (not new, but extended herein)**
 - Quantitative with potentially complex appearance
 - Users are forecasters, but techniques will be new
 - Support limited data comparison
 - Direct manipulation important
- **Class V: Decision Support (not new, but extended herein)**
 - Rapid assessment important
 - Users are not modellers and typically not meteorologists
 - Inherent support for data fusion
 - Weather phenomena may not be shown

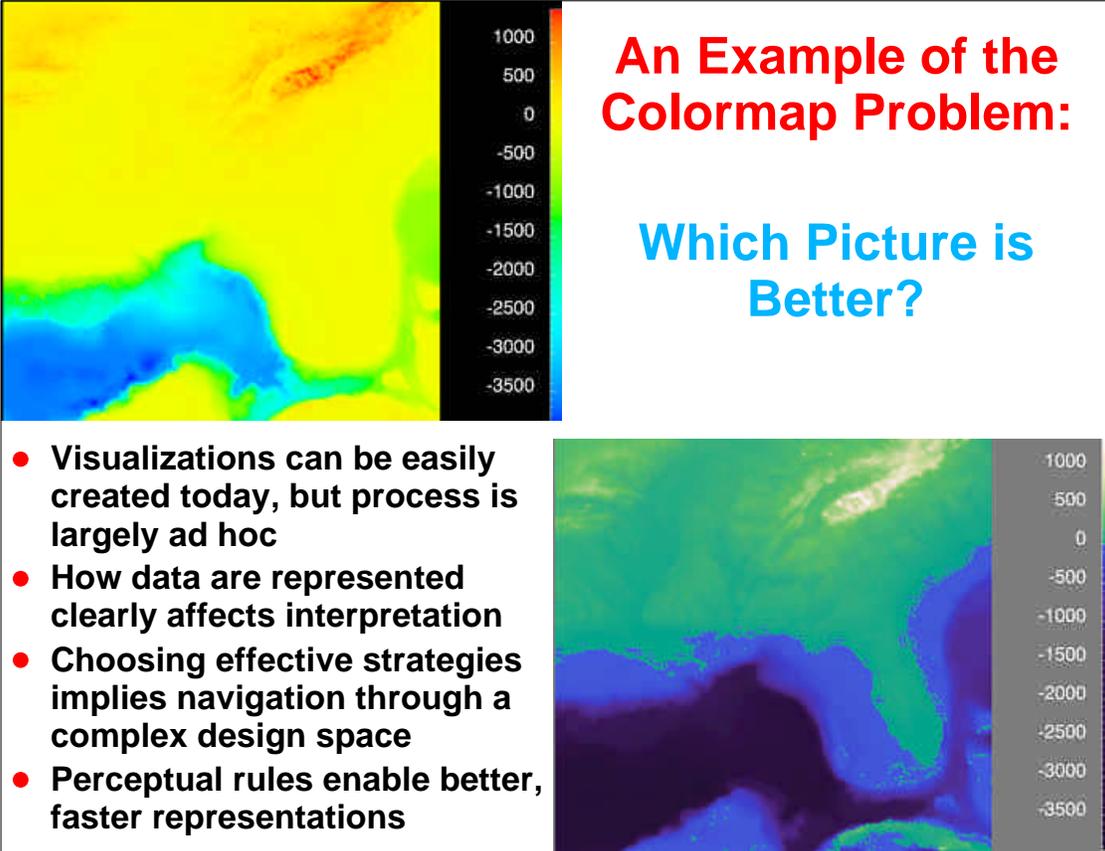

Composition Design Approach

- Identification of distinct user & visualization tasks by same or different users
- Detailed content under user control
- Consistency with data source
- Each data set processed independently
- Visualization and interaction in common, cartographic coordinates
- Both quantitative and qualitative techniques supported
- Multiple, linked displays, static and/or dynamic
- Physical and conceptual realization
- Simplified user interface

A Few Compositional Guidelines

- **Coordinate system for display and interaction**
 - Cartographic projection (horizontal coordinates) dictated by task and/or data
 - Vertical coordinates (terrain-following vs. isobaric) dictated by task (assessment vs. analysis)
- **Color**
 - Colormaps dictated by task (isomorphic vs. segmented) and data (low vs. high spatial frequency, moisture vs. generic)
 - Perceptual rules used for design/selection
 - Individual color(map)s selected to minimize color mixing artifacts
 - Luminance and opacity used for direct volume rendering
 - Opacity mapping with constant color used for surface extraction
- **User tasks drive design**
 - Assessment: surface conditions and cloud properties
 - Analysis: variable selection and technique selection
 - Decision support: impact of weather

An Example of the Colormap Problem:

Which Picture is Better?

- Visualizations can be easily created today, but process is largely ad hoc
- How data are represented clearly affects interpretation
- Choosing effective strategies implies navigation through a complex design space
- Perceptual rules enable better, faster representations

2, 2-1/2D Slice Analysis/View Task

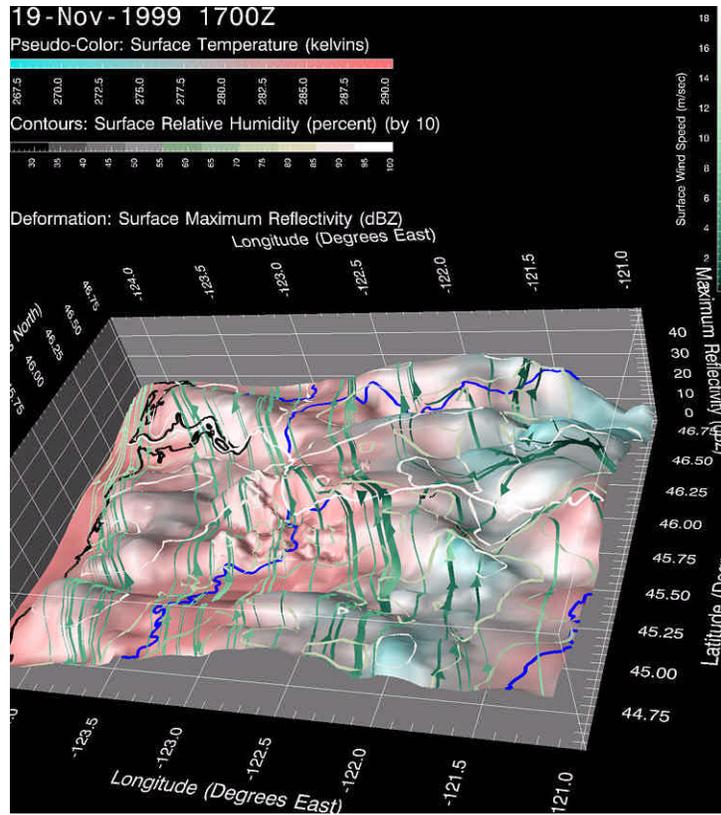

Class II

- Quantitative, interrogation and comparison
- Interaction by forecasters for analysis
- Direct manipulation supported
- Select different variables at specific pressure levels or at surface for use with diverse visualization methods (up to 5)
- Time-based animation
- Superset of Class I
 - Can utilize modern hardware (e.g., parallelism, 3d graphics)

2-1/2D Slice Example

Class II

RAMS

2D, 2-1/2D View/Analyze -- Class I, II

Deep Thunder (Regional Atmospheric Modeling System) -- Slicer

05-Mar-1999 0800Z
 Pseudo-Color: Surface Precipitable Water (mm)
 Contours: Surface Cloud Top (m) (by 2000)
 Labels: Surface Temperature (kelvins)
 Deformation: Surface Potential Temperature (kelvins)

Primary Controls
 Color Slice: Parameter for Pseudo-Color: Precipitable Water (mm)
 Surface Slice: Parameter for Deformed Surface: Potential Temperature (kelvins)
 Label Slice: Parameter for Numeric Labels: Temperature (kelvins)
 Contour Slice: Parameter for Contours: Cloud Top (m)
 Contour Type: Cloud Top (m) Contour Increment: 2000.0
 Lines:
 Probe Precipitable Water (mm)
 Wind Slice: Winds?
 Surface: Arrows

Input Controls
 Year: 1999 Julian Day: 63 Start Hour: 12
 Start: 0 Hour: 24
 End: 24

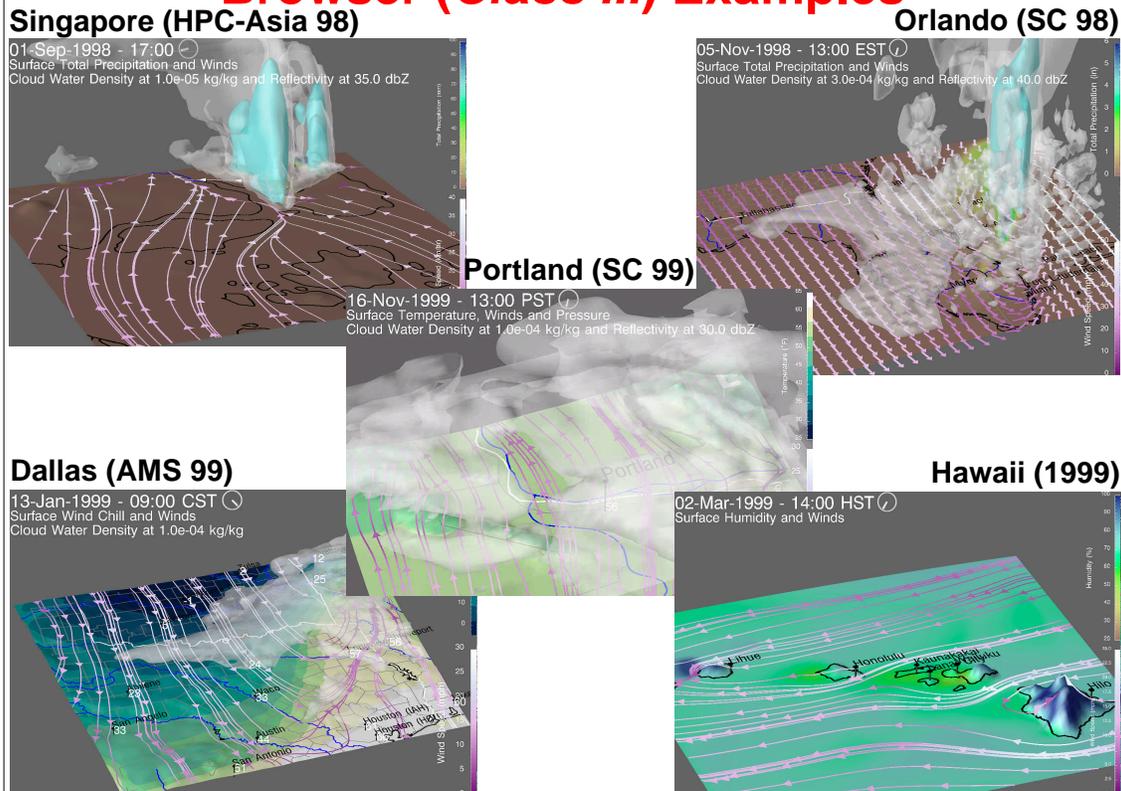

Sequence Control
 [Stop] [Play] [Fast Forward] [Fast Reverse] [Pause] [Next] [Previous] [Home] [End]

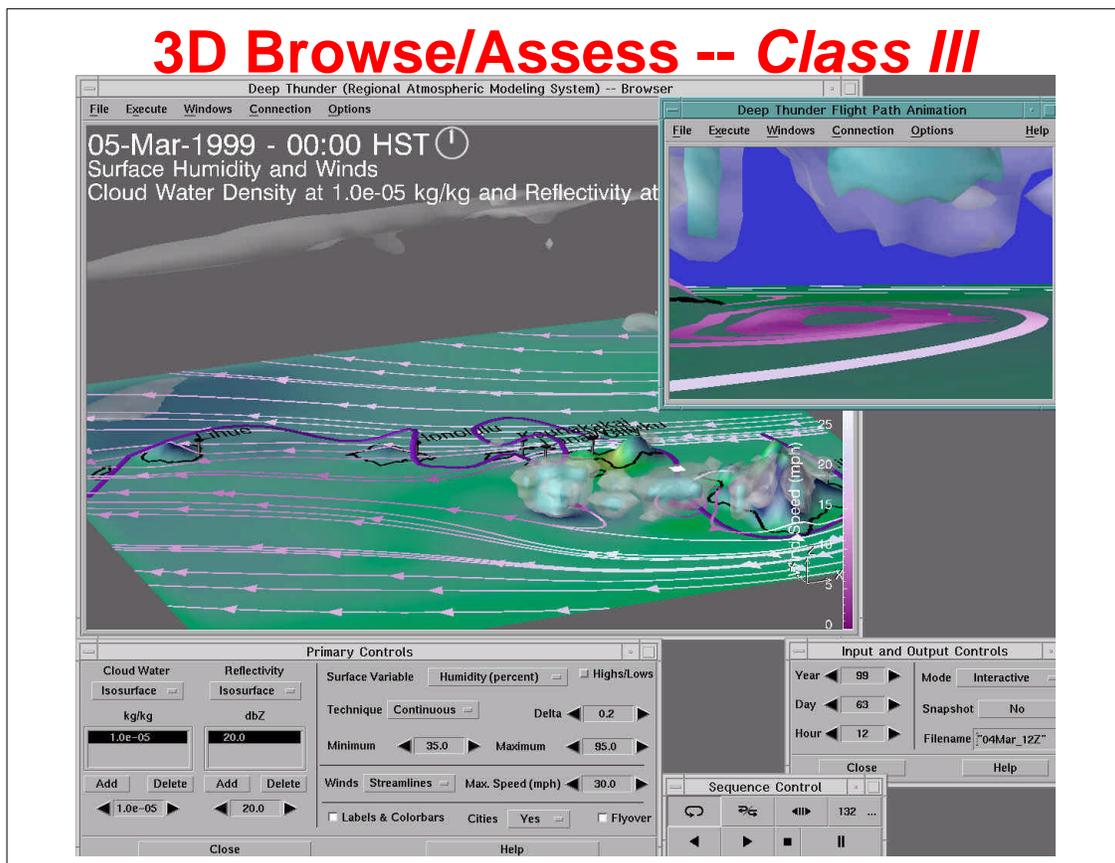

Information
 At { { 19.7, -155.1 } [21.3, -157.9] } Precipitable Water (mm) = { 2.762e+01 2.763e+01 }

Browse Task -- Class III

- **Abstraction of results into single, easy-to-interpret, qualitative 4D product**
 - Effective for data assessment and forecasting
 - Eliminate need to evaluate numerous 2d plots
 - Enables conceptual model for forecast development
 - Interact with and examine data with simple presentation
 - subset of variables for these tasks at high temporal resolution matching model
- **Simple model tracking during execution**
 - Quality control
 - Limited immediate analysis
 - Event identification for later analysis
- **Forecasters and public products (media & www)**
 - Users may or may not be specialists (e.g., forecasters)
 - Time-based animation with fixed view
 - Key-frame animation at fixed time
 - Creation of interactive and static "snapshots" for www

Browser (Class III) Examples

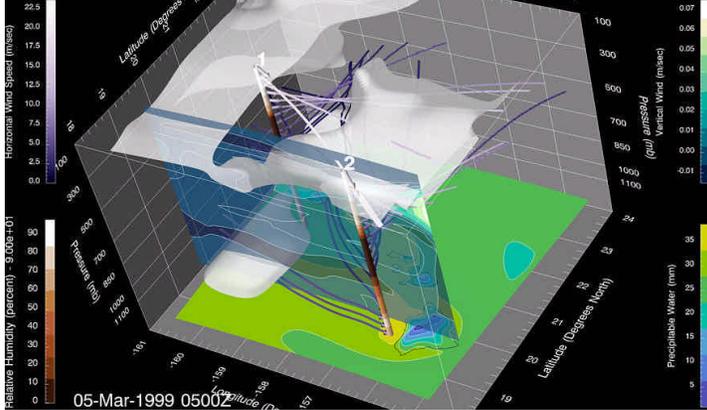

3D Analysis/View Task -- Class IV

- Quantitative and interrogation
- Interaction by forecasters for analysis
- Limited data comparison
- Select different variables for use with diverse visualization methods (up to 5)
- Typical post-processed (model or analysis) data (e.g., all variables every hour of forecast time)
- Time-based animation
- Interaction with "virtual atmosphere": virtual met-station

3D View Examples

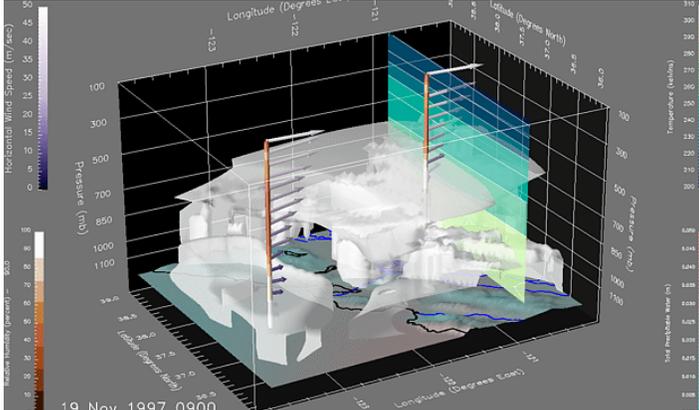

Class IV

RAMS

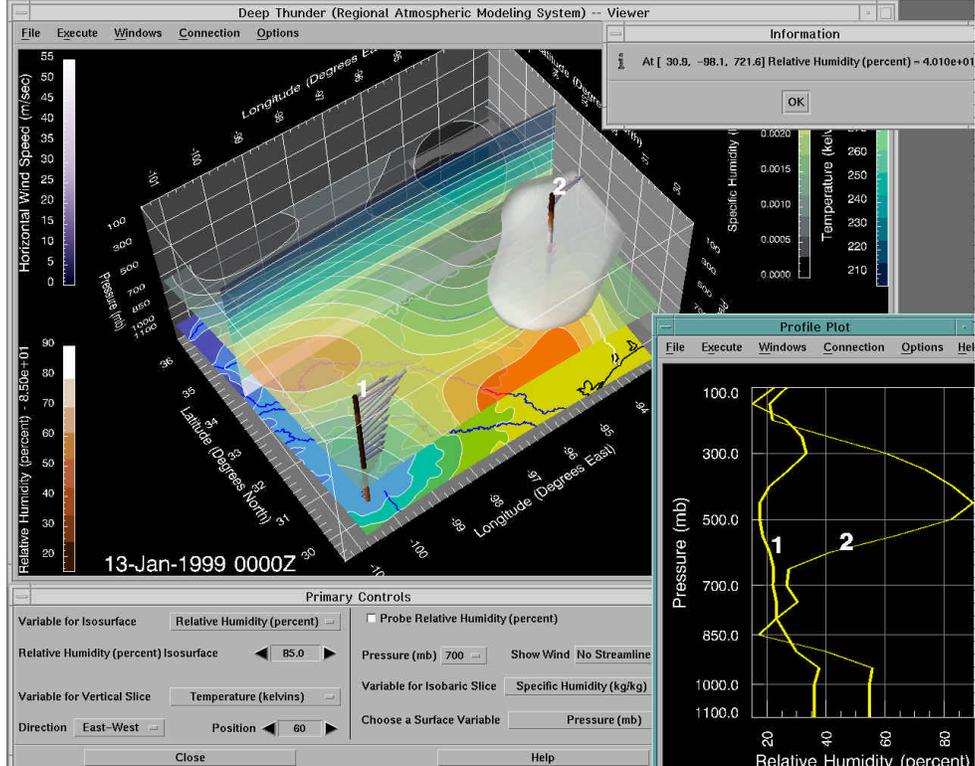

05-Mar-1999 0500Z

LAPS

19 Nov 1997 0900

3D View/Analyze -- Class IV

Deep Thunder (Regional Atmospheric Modeling System) -- Viewer

Information: At [30.3, -98.1, 721.6] Relative Humidity (percent) = 4.010e+01

Profile Plot: Pressure (mb) vs. Relative Humidity (percent)

Primary Controls:

- Variable for Isosurface: Relative Humidity (percent)
- Relative Humidity (percent) Isosurface: 85.0
- Variable for Vertical Slice: Temperature (kelvins)
- Direction: East-West
- Position: 60
- Variable for Isobaric Slice: Specific Humidity (kg/kg)
- Choose a Surface Variable: Pressure (mb)

Deep Thunder New York City Pilot

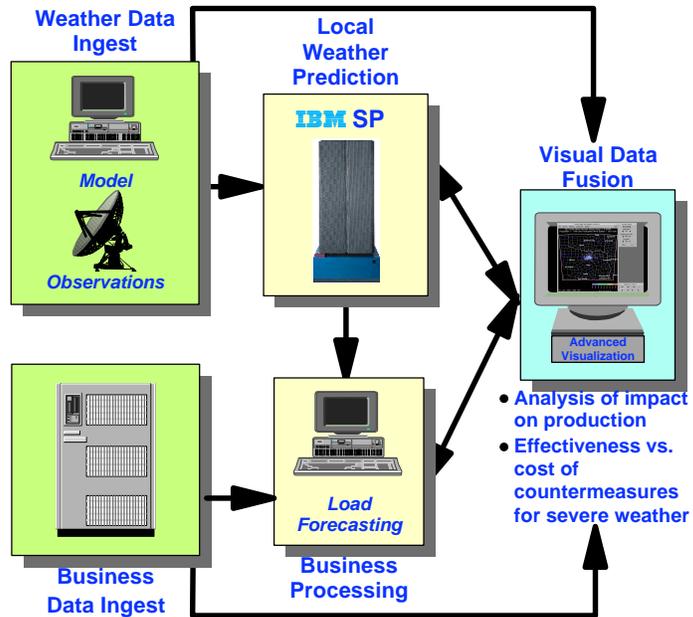

- 1-2 day forecast, nested to 1 km resolution for metropolitan area, 1-4 times/day
- Operational end-to-end infrastructure and automation (data ingest, pre-processing, simulation, post-processing, visualization, dissemination)
- Testbed for continued work in visualization and applications
- Operational implementation of Classes I, II, III and IV
- Extension of Class III for www

Extensions of Class III for WWW

- Typical web-based methods do not scale well -- many mismatches, for example
 - too few time steps
 - too hard to find relevant images
 - limited or no interactivity
- Interactive, 3d image spreadsheet -- high-level
 - Meteorological characteristics vs. model features -- meta-representation of model
 - Each interactive cell is one time step as an index into more visualizations and interactions -- extensible
 - MPEG video at moderate pixel-resolution, but high temporal resolution
 - Specialized (extreme) compression to address data sampling problem
- Interactive applications adapted for automated and parallelized batch execution to generate images & animations

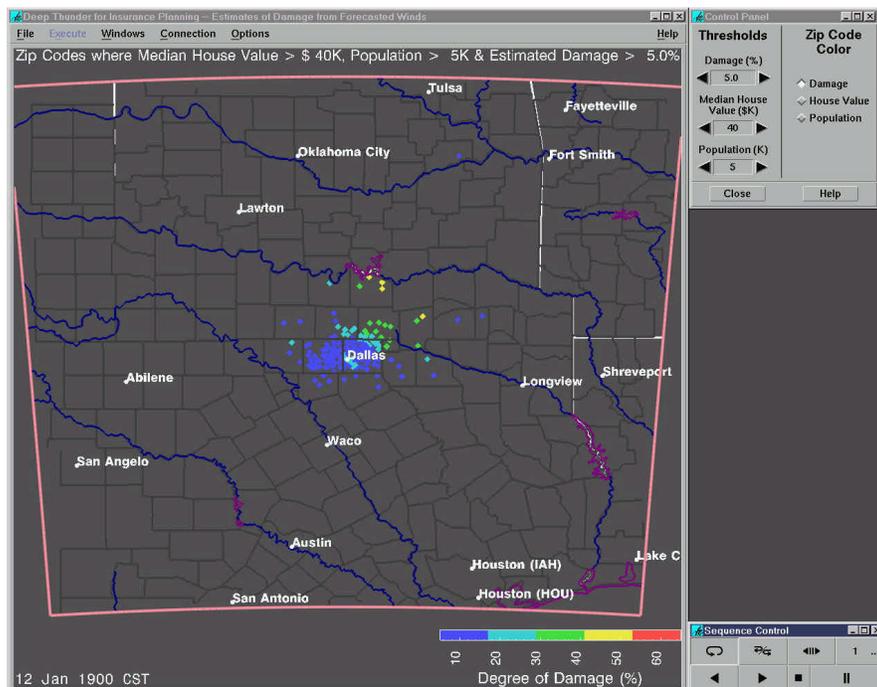

Decision Support -- Class V

- Enable proactive decision making affected by weather
- User goals influence effective design via data fusion
- Customized appearance by data and geography
- Presentation of derived properties critical
- Many potential applications
- Couple to business processes & models:
Load forecasting, groundwater modelling, ...

Decision Support -- (Class V) Example: Insurance, Emergency Planning

- Geographic correlation of demographic and forecast data
- Map shows
 - Zip code locations colored by wind-induced residential building damage
 - Constrained by value, population and wind damage above thresholds

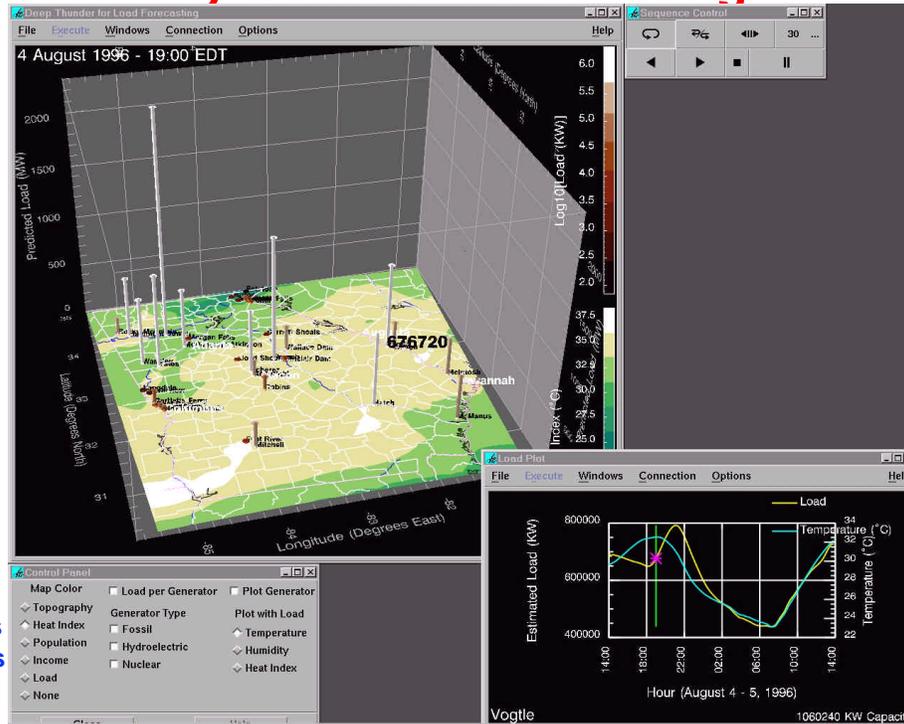

Decision Support -- (Class V) Example: Electricity Demand Forecasting

- **Simple estimated load**

- $f(t, T, H)$ -- color and height
- Scaled by capacity
- Generator data from Georgia Power
- Deep Thunder forecast

- **Map shows**

- Heat index
- State & county boundaries
- Major cities
- Generating plants

Visualization Implementation

- **Core implemented via Data Explorer -- an open source visualization toolkit (www.opendx.org)**
 - Custom tools for new visualization elements and derived meteorological variables
 - Custom tools/packaging for new output products
 - Shared tools and user interface components
 - Simple motif widgets for indirect interaction
 - Direct interaction in appropriate cartographic coordinates
 - **NO** transformation or compression of data or mesh(es)
 - Rule-based colormap tool used during design phase
 - Custom export/rendering www products
- **Integrated with mesoscale forecasting system (*Deep Thunder*)**
 - Custom I/O to balance communications, reduce latency
 - Custom filters for data import
- **Supplemented with utilities for animation conversion (e.g., video, www) built upon ImageMagick**

Conclusions

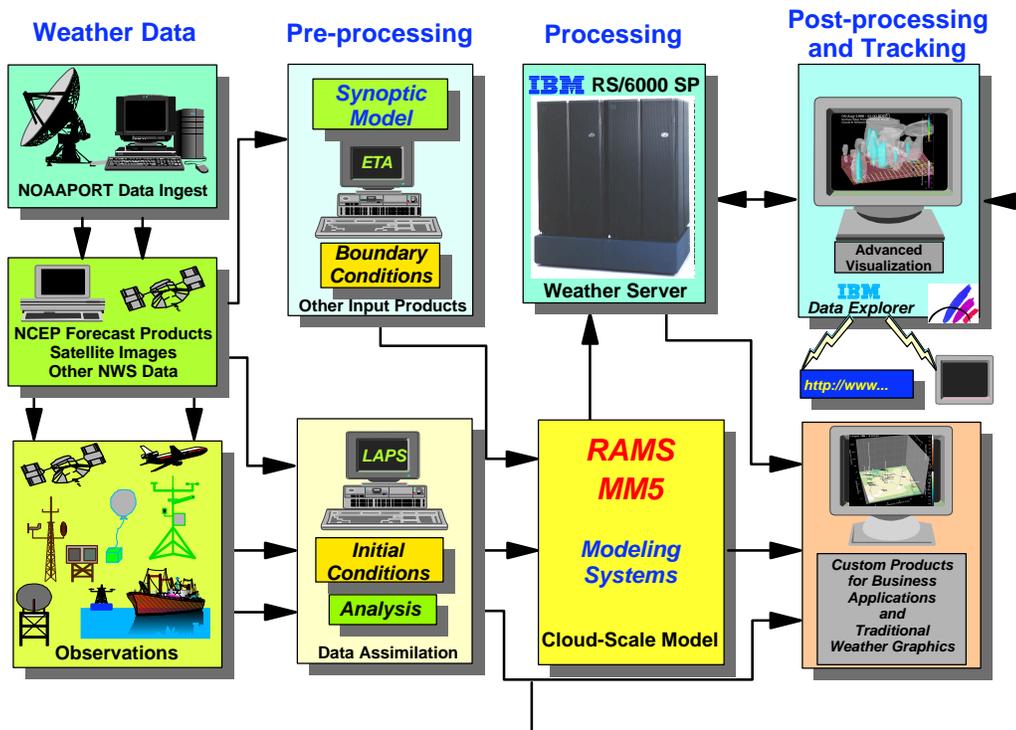

- Hierarchical decomposition of user goals and visualization tasks and design useful
- Avoid "kitchen sink" approach: Do NOT support too many tasks and users in one application
- No single visualization is typically adequate for a given user goal
- Same users may have different goals
- Although different users may have not have the same goals, they may share visualization tasks (and be able to utilize common tools)
- Operational activities expand the potential tasks from the traditional scientific visualization ones

Future Work

- Develop task decomposition for other applications and implement customized interfaces, products and packaging
 - For example, aviation, broadcast, insurance, energy, agriculture
- Continue to develop specialized compression techniques for web deployment
- Extend tools to other models and data products and evaluate validity of decomposition
- Enhance model tracking/steering and interactivity (Class III)
- Improve model input/output (all classes)
- Incorporate new visualization techniques

Backup Slides

Motivation: Applications of *Deep Thunder*

Visualization in Meteorology

- **Visualization in meteorology has rich tradition and history**
 - Research community among earliest users of both modern visualization techniques and supercomputing (e.g., Wilhelmson et al, NCSA thunderstorm)
- **Plethora of operational 2d tools with essentially same content design**
 - Typical focus on analysis
 - Philosophy of "one size fits all", independent of user or task
 - 2d techniques dominate
 - Limited use of 3d mostly for post-processing
 - Potential mismatch between users and interface
- **Good choice as a testbed**

Related 3D Work in Operational Meteorology (Derived from the Research Community)

- **U. Wisconsin Vis-5D**
 - Single design/interface for limited 3d data only, users & tasks
 - Home-grown (X/OpenGL), public domain
 - Optimized for performance on regular grids, compressed data
 - Assumption of an analysis task
- **NOAA/Forecast Systems Laboratory D3D**
 - Single design/interface for limited 3d data only, users & tasks
 - Originally utilized AVS, but now based upon Vis-5D
 - Assumption of an analysis task
 - Focus on user interface consistent with other applications
- **Fraunhofer Institut für Graphische Datenverarbeitung (with Deutscher Wetterdienst)**
 - Different systems and interfaces for different tasks AND users
 - Only share underlying renderer
 - Triton: 2d data for non-meteorologist
 - TriVis: 2d and 3d data for non-meteorologist via broadcast meteorologist
 - RASSIN: 3d analysis by meteorologist

Common Goals of Visualization

- **Exploration (undirected search)**
 - See relationships, test hypotheses
 - You don't know what you are looking for
- **Analysis (directed search)**
 - Gain insight to make decisions
 - You already have a sense of what you are trying to learn
- **Communication (presentation)**
 - Share results, convince, and promote
 - You already know the answer

"you can see a lot by observing" (Yogi Berra)

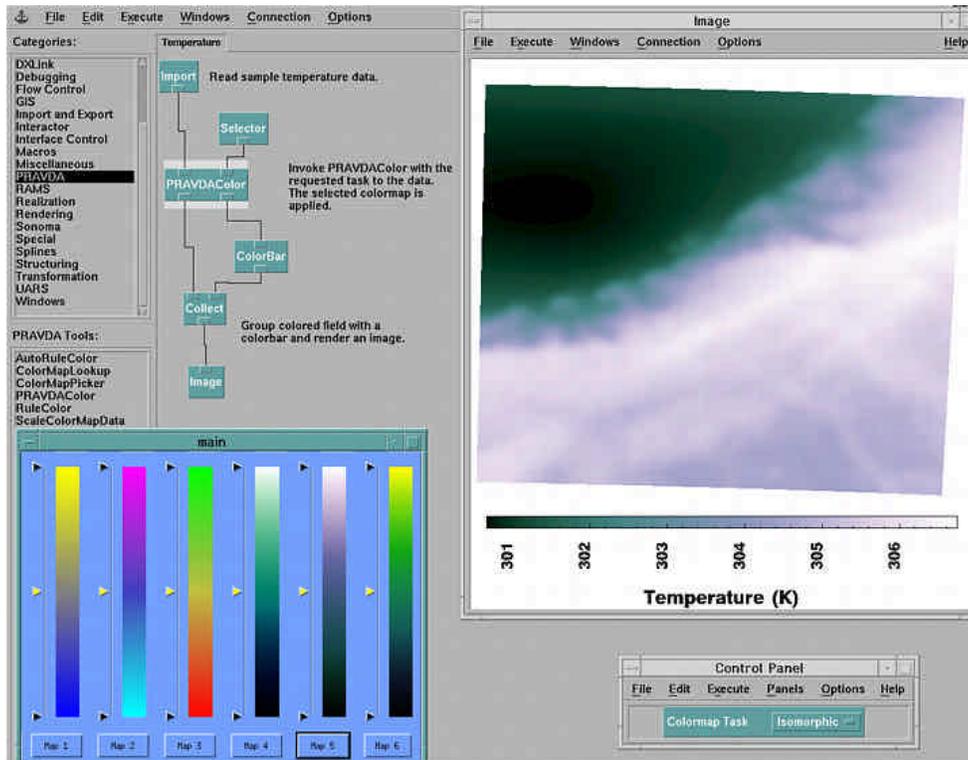

Stages of User-Centric Software Development

- Define the application in terms of its users, their goals and tasks
- Design the application and its interface to implement that definition
- Prototype the design
- Test the design with users to identify design flaws that prevent users from achieving their goals
- Fix the design flaws, then redesign, reprototype, and retest until an acceptable usability level is achieved
- Develop the application, do final testing and test the support documentation
- Deliver the final application and assess the design's success in field use

Compositional Guidelines (Task and User Metadata)

- **Coordinate system for display and interaction**
 - Cartographic projection (horizontal coordinates) dictated by task and/or data
 - Vertical coordinates (terrain-following vs. isobaric) dictated by task (assessment vs. analysis)
- **Color**
 - Colormaps dictated by task (isomorphic vs. segmented) and data (low vs. high spatial frequency, moisture vs. generic)
 - Perceptual rules used for design/selection
 - Individual color(map)s selected to minimize color mixing artifacts
 - Luminance and opacity used for direct volume rendering
 - Opacity mapping with constant color used for surface extraction

Rule-Based Advisory Tool for Colormaps

Compositional Guidelines *(continued)*

- **Realization**

- Surface data warped on terrain in 3d scene
- Overlay of vector maps and markers for annotation
- Color-filled contour banding used with segmented colormap
- Surface wind dictated by task
 - Fixed glyphs (2d arrows, 3d flags) as animated texture for global features
 - Streamlines with directional arrows for boundary (e.g., fronts, convergence zone) evolution
- *Virtual met station* for 3d analysis/interrogation tasks
- Multiple encodings for analysis/comparison tasks

- **User tasks**

- **Assessment:** surface conditions and cloud properties
- **Analysis:** variable selection and technique selection

Browse Task (Class III Continued)

- **Event/Feature identification**

- Gross atmospheric motion
- Convective activity
- Potential distribution of motion
- Land-sea interaction
 - sea breezes
 - convergence zones
- Orographic effects
- Vertical Motion

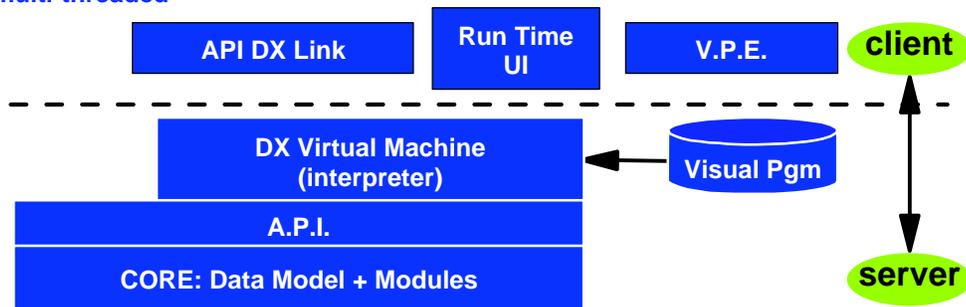

- **Visualization subtasks:**

continuous domain vs. segmentation

- Volume rendering vs. isosurface(s) for cloud properties
- Isomorphic colormap vs. contour banding with segmented colormap for surface data
- Streamlines vs. glyph techniques for surface winds
- Animation with temporal and spatial coherence important

Data Explorer - <http://www.opendx.org>

- **Six main modular software components as client-server providing**
 - API and turnkey development
 - Visualization authoring
 - Links to other applications
 - End-user tool
- **Client (user interface) on same or different machines**
- **Server (compute engine)**
 - parallelized on SMPs
 - distributed on networks
 - multi-threaded
- **Open source development**
- **Multi-platform support**
 - Unix: IBM, HP, Sun, SGI, DEC, Linux, etc.
 - Wintel: 95, 98, NT and 2000
- **Single unified data model for all data types**
 - Handles all data (imported & derived)
 - Supports building of applications and exchange of data
 - Promotes efficiency
 - Self-describing and user-extensible

Visualization Configuration

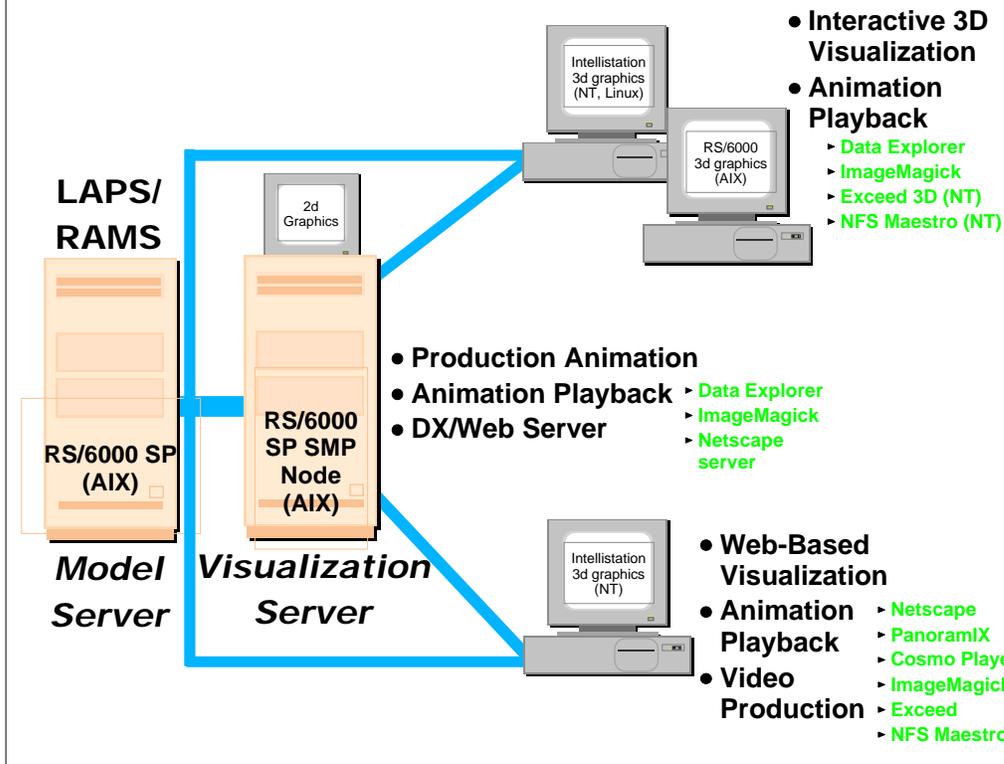

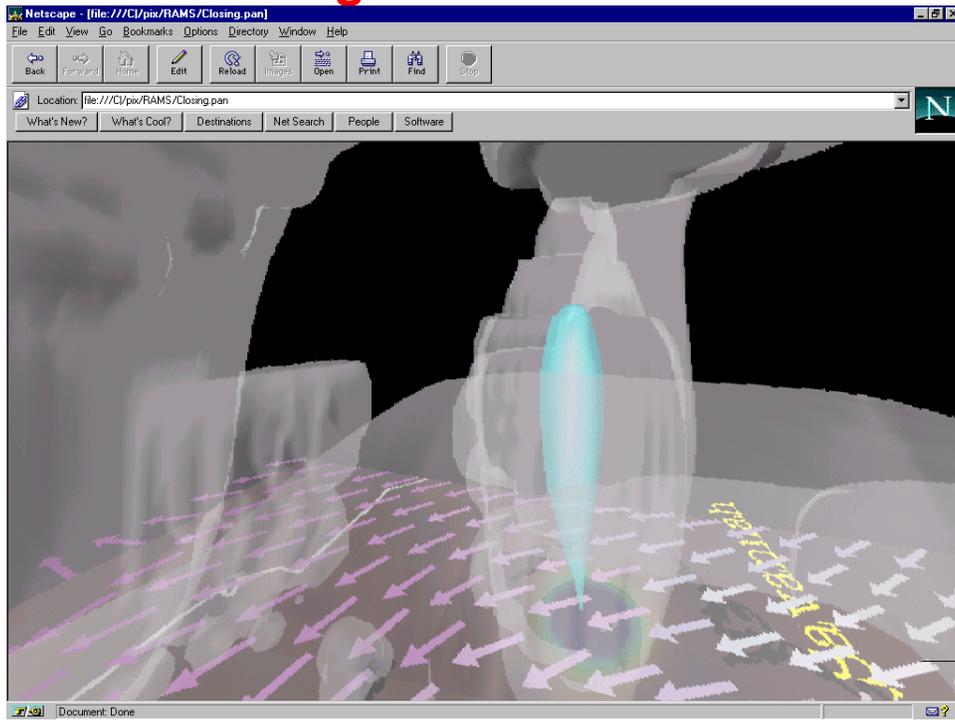

Image-based Interaction of Weather Forecasting Scene via PanoramIX

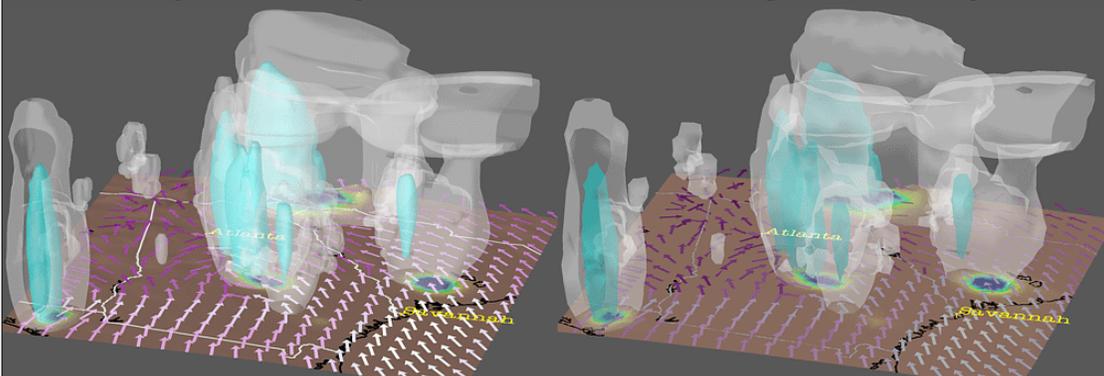

Geometric Simplification

- Reduce download time and improve interactivity
- Each component of the visualization is separately simplified with different constraints

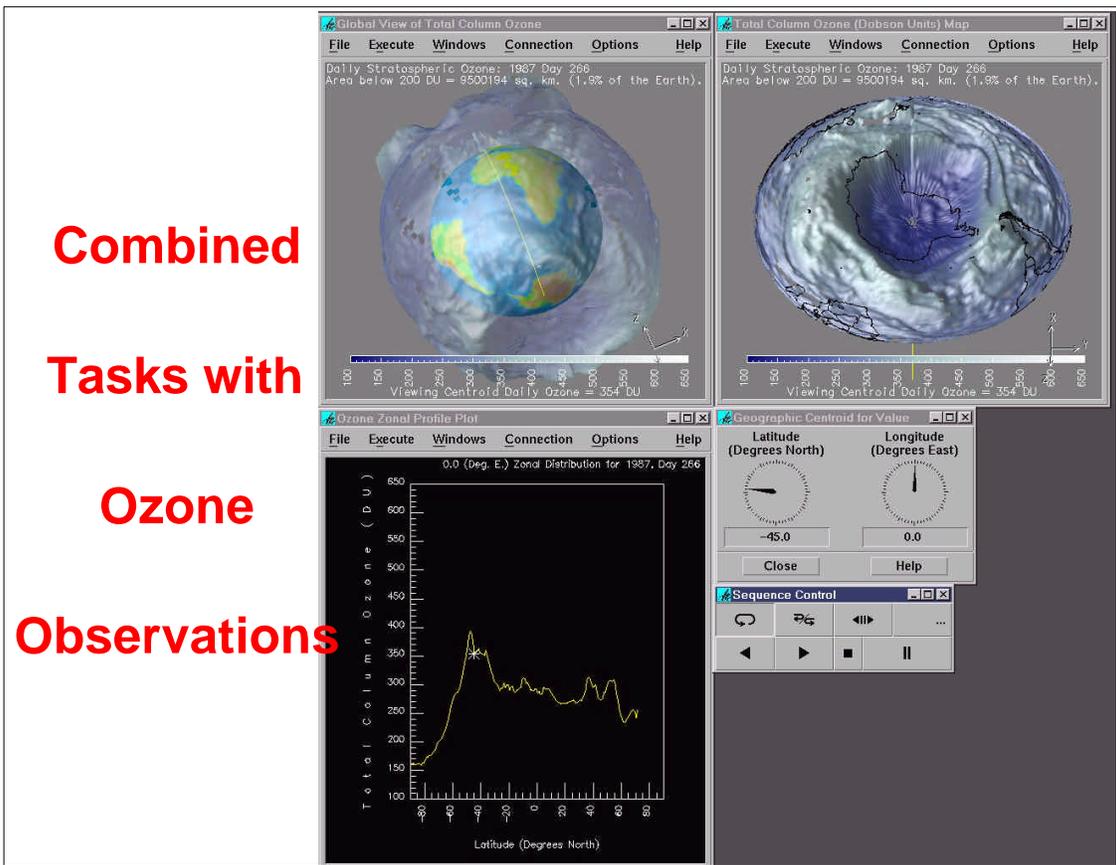

Sample Weather Model Realization:
 Cloud Water, Reflectivity, Precipitation, Wind, Topography & Maps

Original Geometry

Simplified Geometry

343K to 40K triangles

Weather-Specific Conclusions

- **Class III more effective than expected for general forecasting tasks**
 - Quick and accurate model assessment via compact representation, supporting conceptual and physical models
 - Eliminates need for tedious use of 2d methods
- **Class II and IV:**
 - Efficient approach to correlative analysis
 - Direct manipulation enables more than just display
- **Limitations in data management**
 - Data processing and model I/O poorly designed for interactive applications -- both direct or post-processing
 - Incomplete metadata management, primarily impacting Class II and IV applications
